

# Cloud-Watch Custom Matrix

## **Aws Documentation link:-**

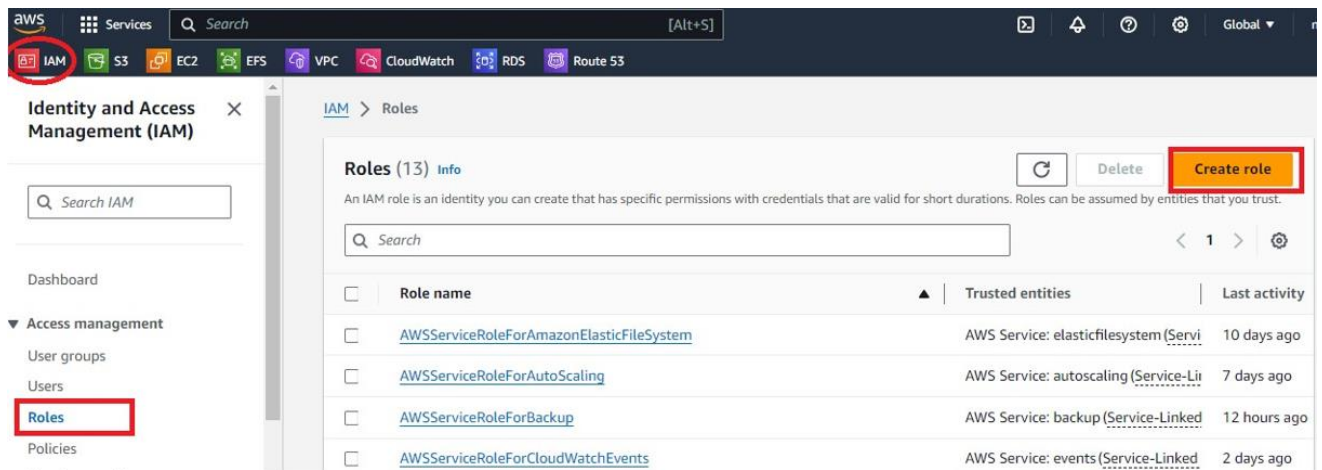

<https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/monitoring-scripts-intro.html>

## **What is Cloudwatch Custom matrix ??**

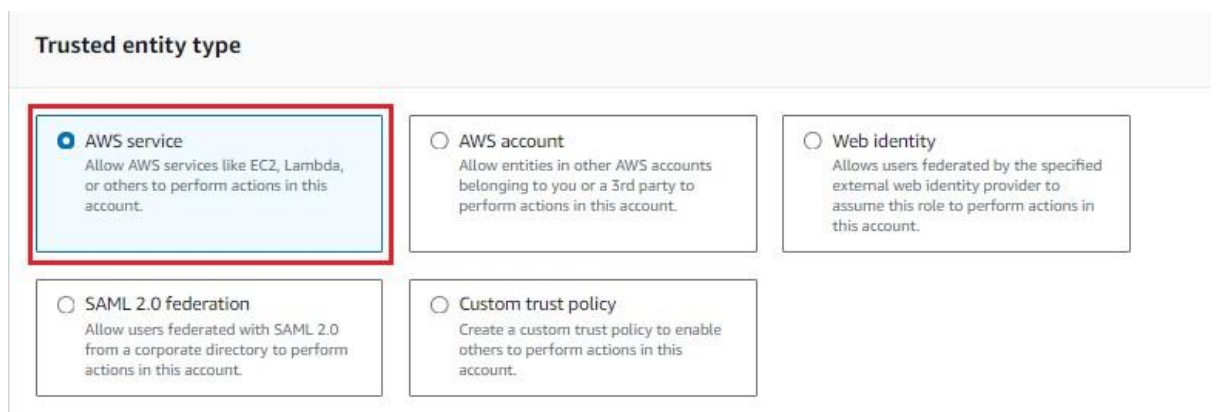

Custom metrics in CloudWatch allow you to monitor and collect data about your applications, services, and resources that are not automatically provided by AWS.

### **1. Creating role for ec2 instance**

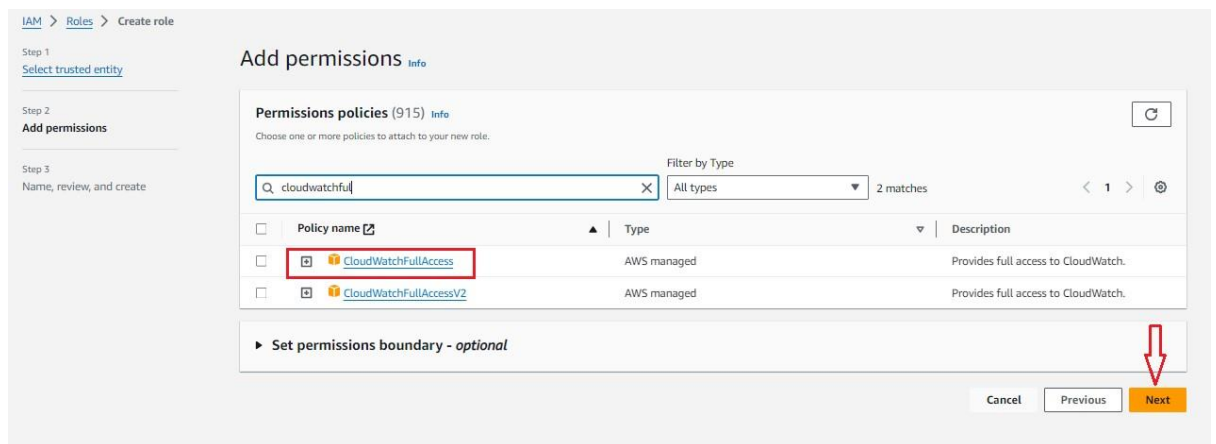

- Select IAM service & click on create role

- Select Ec2 Service & click on next

- Select The permission policy & click on next

- Assign name and click on next

**#policy created successfully.....**

## 2. Create Ec2 Instance

Select Amazon AMI 2 machine for performing this practical because The monitoring scripts were tested on instances using the following systems.....

Amazon Linux 2

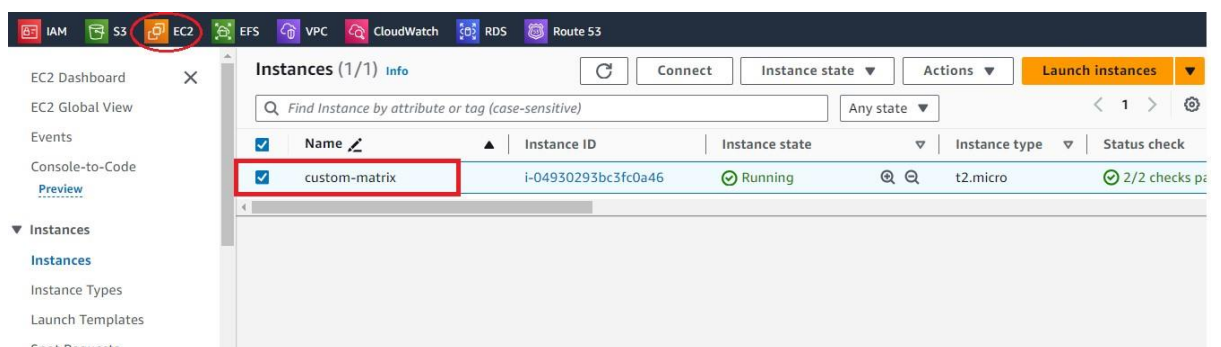

Amazon Linux AMI 2014.09.2 and later

Red Hat Enterprise Linux 6.9 and 7.4

SUSE Linux Enterprise Server 12

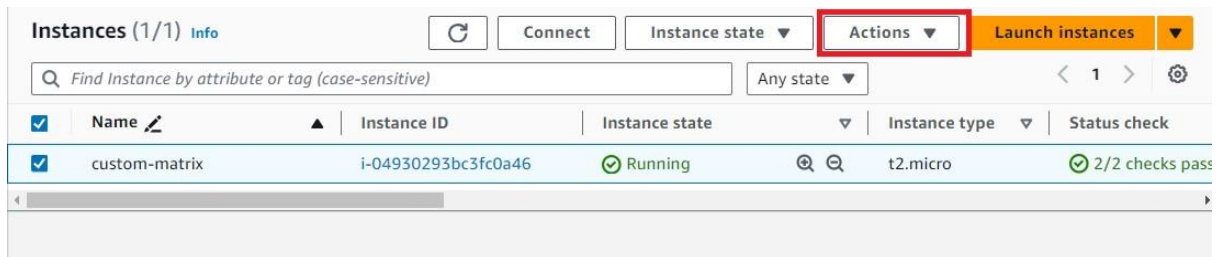

Ubuntu Server 14.04 and 16.04

- **Amazon Linux 2 Instance created successfully.....**

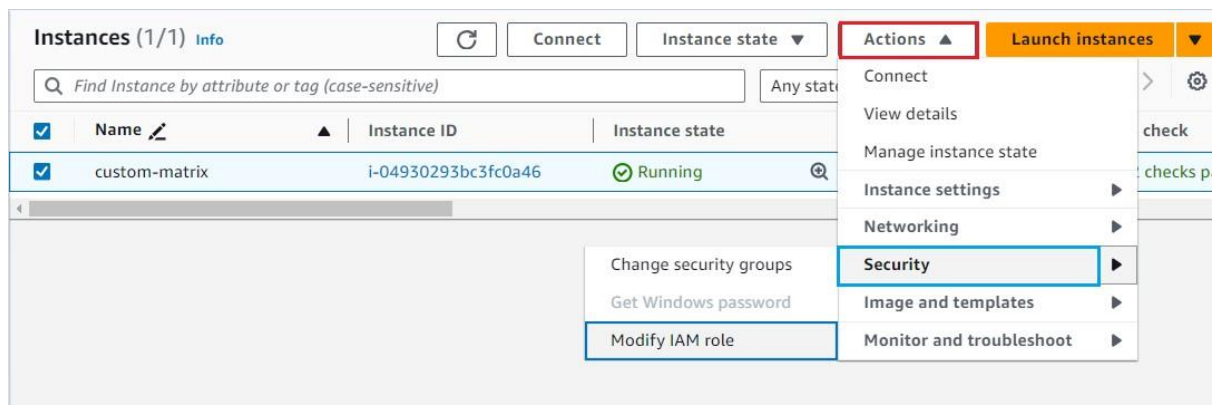

### 3. Assign role To Ec2 Instance

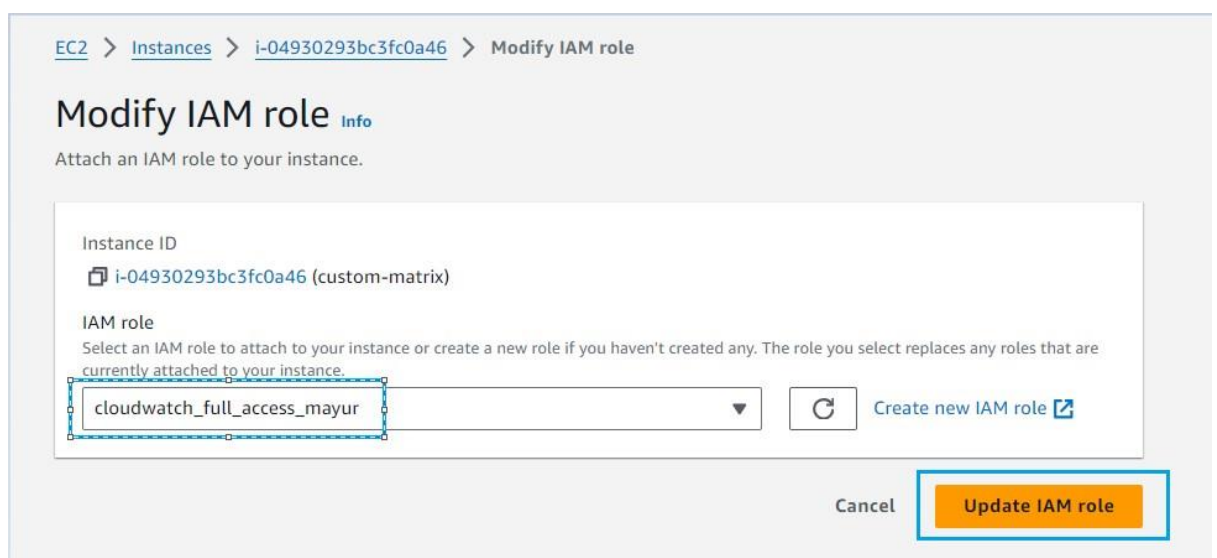

- Select the Created instance & click on Action option

- Under Security option Click on Modify IAM role

- Select The role And click on update IAM role

➤ **Role attached successfully.....**

(Now we can able to perform all actions on Cloudwatch service using EC2 instance...)

#### **4. Install required packages**

```
{ { sudo yum install -y perl-Switch perl-DateTime perl-Sys-Syslog perl-LWP-Protocol-https perl-Digest-SHA.x86_64 } }
```

#### **5. Install monitoring scripts**

**Run the following commands For installing the monitoring script** curl

```
https://aws-  
cloudwatch.s3.amazonaws.com/downloads/CloudWatchMonitoringScripts-  
1.2.2.zip -O
```

**Run the following commands to install the monitoring scripts you downloaded:**

```
unzip CloudWatchMonitoringScripts-1.2.2.zip && \  
rm CloudWatchMonitoringScripts-1.2.2.zip && \ cd  
aws-scripts-mon
```

#### **6. Run The script as per your Requirement**

```
{ { ./mon-put-instance-data.pl --mem-util --mem-used --mem-avail } }
```

(note: for every time we need to push the data from our instance to cloudwatch service. For avoiding this issue we use crontab tool for automation....)

## 7. Automation using Crontab

- Add this script in crontab using (Crontab -e )

```
* * * * * /home/ec2-user/aws-scripts-mon/./mon-put-instance-data.pl --mem-util --mem-used --mem-avail
```

- Save & restart the **crond** service

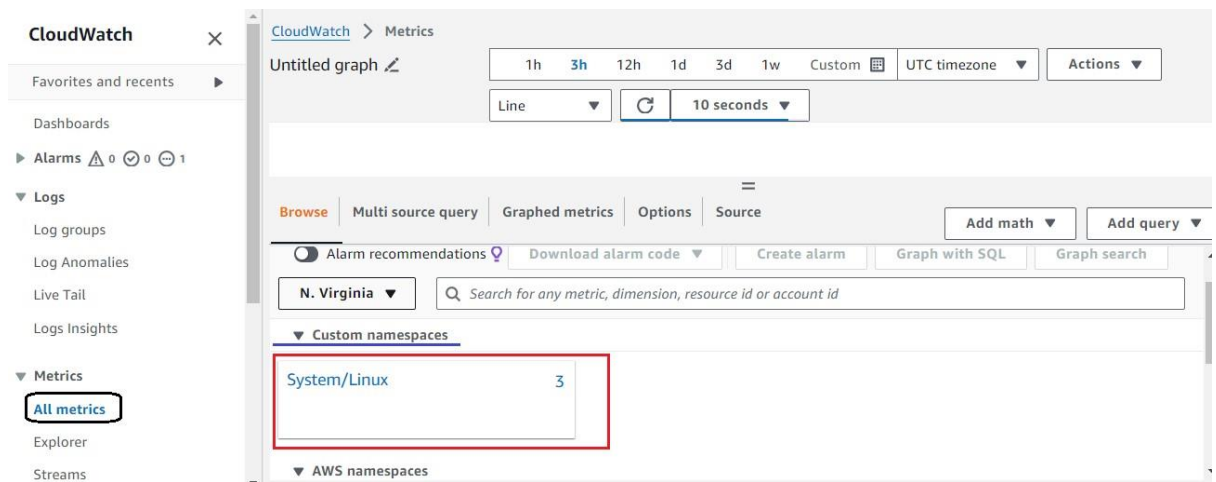

```
sudo systemctl restart crond
```

```
[ec2-user@ip-172-31-37-162 aws-scripts-mon]$ sudo systemctl restart crond
You have new mail in /var/spool/mail/ec2-user
[ec2-user@ip-172-31-37-162 aws-scripts-mon]$ sudo systemctl status crond
● crond.service - Command Scheduler
   Loaded: loaded (/usr/lib/systemd/system/crond.service; enabled; vendor preset: enabled)
   Active: active (running) since Thu 2024-03-14 21:08:21 UTC; 9s ago
     Main PID: 3928 (crond)
    CGroup: /system.slice/crond.service
            └─3928 /usr/sbin/crond -n

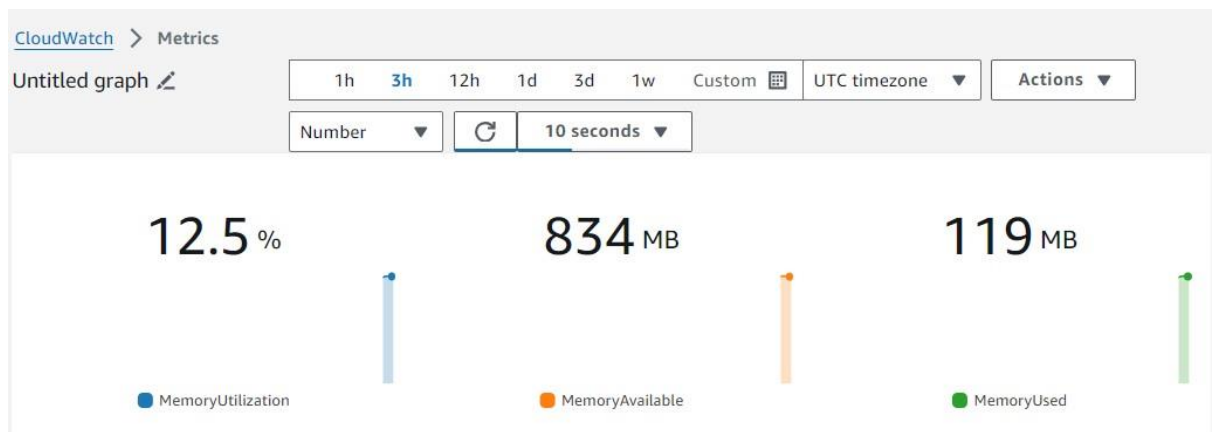

Mar 14 21:08:21 ip-172-31-37-162.ec2.internal systemd[1]: Stopped Command Scheduler.
Mar 14 21:08:21 ip-172-31-37-162.ec2.internal systemd[1]: Started Command Scheduler.
Mar 14 21:08:21 ip-172-31-37-162.ec2.internal crond[3928]: (CRON) INFO (RANDOM_DELAY will be scaled with factor 76% if used.)
Mar 14 21:08:21 ip-172-31-37-162.ec2.internal crond[3928]: (CRON) INFO (running with inotify support)
Mar 14 21:08:21 ip-172-31-37-162.ec2.internal crond[3928]: (CRON) INFO (@reboot jobs will be run at computer's startup.)
[ec2-user@ip-172-31-37-162 aws-scripts-mon]$
```

## 8. Result

- Successfully pushed the data from Ec2 instance to cloudwatch service....

- Result is shown in numbers

## CloudWatch Agent on Our servers

### **\*\*Configuring Cloudwatch agent on Ubuntu operation system\*\***

#### **1. Launch the Ubuntu instance**

While launching the instance add this user-data script or we can do after installing as well....

&& make sure to add http port (80) in security group

```
#!/bin/bash
sudo apt install apache2 -y
sudo systemctl start apache2
sudo systemctl enable apache2
|
```

**Successfully launch the Ubuntu instance....**

## 2. Configuration on Ubuntu instance

- Downloading amazon cloudwatch agent

sudo wget

<https://s3.amazonaws.com/amazoncloudwatchagent/debian/amd64/latest/amazon-cloudwatch-agent.deb>

- Install the agent

sudo dpkg -i -E ./amazon-cloudwatch-agent.deb

- Start Configuring the agent

sudo /opt/aws/amazon-cloudwatch-agent/bin/amazon-cloudwatch-agentconfig-wizard

- Some important options we need to assign "default\_user":

"root"

"file\_path": "/var/log/apache2/access.log",

"log\_group\_class": "STANDARD",

"log\_group\_name": "demo-ec2-apache.logs",

"log\_stream\_name": "apache.access.log",

"retention\_in\_days": -1

- Result is stored here

Go through all the steps in the wizard (The result is saved here:  
/opt/aws/amazon-cloudwatch-agent/bin/config.json)

- For checking configuration

```
cat /opt/aws/amazon-cloudwatch-agent/bin/config.json
```

➤ Installing collectd

- `sudo apt-get update -y`
- `sudo apt-get install collectd`
- `sudo /opt/aws/amazon-cloudwatch-agent/bin/amazoncloudwatch-agent-ctl -a fetch-config -m ec2 -c file:/opt/aws/amazon-cloudwatch-agent/bin/config.json -s`
- `sudo /opt/aws/amazon-cloudwatch-agent/bin/amazoncloudwatch-agent-ctl -a status ----->` to check status

### 3. Result

- After successfully completing the configuration we get the access.log file in Log Group section ....
